23. Remarks This Category III DIE evaluates activities on the surface Exploratory Studies Facility (ESF) and establishes Quality Assurance Controls to prevent or minimize the potential impact of such activities on site characterization data, the waste isolation capabilities of a potential geologic repository at the Yucca Mountain site, or other Q-List items that have been constructed or installed at the Yucca Mountain site. This DIE is required to be used as input to the applicable implementing documents for the evaluated activities. This DIE will be distributed as a controlled document in accordance with procedure QAP-6-1.					
* Individuals assigned to prepare or check specific Sections of this DIE are also responsible for preparing or checking (as applicable) any Attachments that support those Sections.					

Determination of Importance Evaluation Revision Record

DIE Title Determination of Importance Evaluation for the Surface Exploratory Studies Facility		
DI Number (include revision number) BAB000000-01717-2200-00106 Rev 02		
Rev No.	Date	Description of Revision
00	03/14/96	Original Issue.
01	05/17/96	Revised Sections 6, 11, 13, and Attachment VIII of the analysis to include specific blasting activities required for application of pre-shearing blasting techniques for excavation of the boxcut/headwall of the South Portal and Pad.
		Added descriptions (Sections 1 and 6) and evaluations (Sections 10, 11, 13 and Attachment XIII) for environmental reclamation, meteorologic, and radiological monitoring activities.
		Added descriptions (Sections 1 and 6), reviewed, and evaluated as appropriate (Sections 10, 11, and 13) of the site grounding and lightning protection systems for the South Portal and Pad.
		Change verbiage from inspections to checks/surveillances throughout the document.
		Revised QA requirements 5, 7, 10, and 11 to reflect revisions to the evaluation.
		Updated and added references to support analysis.
		Change ESFDR cites to reflect Revision 2 of the ESFDR.
		Identified additional TIE and WIE documents superseded by this revision.
		Made minor editorial revisions throughout document.
02	02/14/97	Revision 02 revises the evaluation of reclamation materials to consider biodegradability; prohibits the use of the dust suppression compound, DUSTAC®, within the CCAB without additional evaluation (required because of a recent change to the main chemical constituent of DUSTAC®); deletes two attachments associated with DUSTAC® (Attachments IX and X were deleted, and Attachments XI, XII, and XIII were renumbered as Attachments IX, X, and XI, respectively); makes changes to the text as appropriate based on a review of the use of certain words having precise definitions within the argot of the QA Program (e.g., "surveillance," "inspection," "monitoring"); updates references as appropriate; and makes various minor editorial, grammatical and/or
